

SERP Agent Agentic AI Workflow

How the AI agent works - a plain-English guide for everyone

[Chat Agent](#)[Gemini AI](#)[Serper Search](#)[Multi-Client](#)[Reports](#)[Roles](#)

This guide explains, in simple terms, how SERP Agent works: how you ask it questions in plain language, how the AI plans and carries out the steps, how it checks real Google rankings, and how the same system can be reused for any client or website. No technical background needed.

What this guide covers

- What SERP Agent is, in plain words
- What 'Agentic AI' means and why it matters
- The end-to-end flow: how a request becomes an answer
- A real, step-by-step example of the agent thinking
- The agent's toolbox and how it stays accurate
- How it is built generically to reuse for any client

Fig. Chat home - quick actions and example prompts

1. What is SERP Agent?

SERP Agent is a smart assistant for tracking where a website appears on Google. Instead of running reports and reading spreadsheets, you simply chat with it in plain language - like talking to a colleague - and it does the work for you.

"SERP" just means a Google search results page. So you can ask things like:

- "Where does my website rank for 'home care services in Detroit'?"
- "Who are my top competitors for this keyword?"
- "Audit my website" or "Give me ideas to improve my ranking."

It supports many clients at once, and several team members - each sees only their own projects, while an admin sees everything.

The image shows a web interface for 'SERP AGENT' with a 'Create your account' form. The form is set against a dark blue background. The form itself is white with blue accents. It includes input fields for 'Full name' (with a person icon), 'Email' (with an envelope icon), 'Password' (with a lock icon and a hint 'At least 6 characters'), 'Organization name' (with a building icon), and 'Organization code' (with a key icon and a hint 'Provided by your admin'). Below these fields is a small text prompt 'Ask your admin for the team sign-up code.' and a large blue 'Create account' button. At the bottom, there is a link that says 'Already have an account? Sign in'.

2. What does 'Agentic AI' mean?

A normal program does one fixed thing. An AGENT is different: you give it a goal in your own words, and it figures out the steps itself, does them, and explains the result. Think of a helpful assistant who, when asked 'how do we rank and how can we improve?', knows to:

- **PLAN**
decide the steps (first check the rank, then suggest improvements).
- **ACT**
do each step (search Google, read the results).
- **OBSERVE**
look at what came back.
- **ANSWER**

explain it clearly in plain language.

In one line: you ask in plain English -> the AI plans the steps -> it uses the right tools -> it reads the results -> it replies in plain English.

3. The end-to-end flow

Every request moves through four stages. The AI 'brain' is used at the start (to plan) and at the end (to write the answer). The 'tools' do the real-world work in the middle.

Whatever the tools collect (a real Google results page, or a page's content) is handed back to the AI brain, which turns the raw data into a clear, useful reply.

What powers each stage

- **The brain:**
Google Gemini plans and writes. If it is ever unavailable, a free backup model takes over automatically.
- **The search:**
Serper returns the REAL Google top-100 results, so positions are accurate even deep ones (page 4, 5...).
- **The tools:**
small single-purpose helpers - check a rank, compare competitors, audit a site, recommend fixes, run a full scan.

4. How the agent thinks (a real example)

You see each step appear live in the chat as the agent works.

Example: "Check rank for 'home care in Troy' and how to improve"

- **Plan:**
Gemini decides two steps are needed - check the ranking, then suggest tips.
- **Act (check rank):**
searches Google via Serper and finds the position, e.g. 4.6 (page 4, result 6).
- **Act (recommend):**
uses the ranking + competitors to ask Gemini for specific SEO ideas.
- **Answer:**
combines both into one clear reply, shows a result card, and saves a report.

Smart safety check: if a request is missing a detail - e.g. you ask about a website but don't say which - the agent does NOT guess. It pauses and asks you ("Which website?") with clickable options and a box to type the address.

5. The agent's toolbox

The agent chooses the right tool automatically - you never pick one manually.

- **Check a keyword's rank:**
your exact Google position for one keyword (real top-100).
- **Compare competitors:**
which websites outrank you for a keyword, and why.
- **Audit my website:**
SEO basics: title, H1, meta description, reviews, word count.
- **SEO recommendations:**
concrete, practical ideas to improve a keyword's ranking.
- **List keywords:**
all keywords and locations tracked for the client.
- **Run full scan:**
checks many keywords at once and builds an Excel + CSV report.
- **Ask to clarify:**
requests a missing detail (which website / which keyword).

Fig. A keyword scan running inside the chat

6. Built generically (reusable for any client)

The tool is not locked to one company - the same system works for ANY client or website.

- **Multiple clients:**
each client has its own website + keyword list; switch the active client from a dropdown and everything retargets instantly.

- **Any website on the fly:**
in chat you can check ANY site for ANY keyword, even one that isn't a saved client.
- **Editable keywords:**
add or upload keywords (CSV) per client - no code changes.
- **Pluggable search:**
the search engine is swappable without touching the rest.

The generic recipe: (1) define small tools, (2) let an AI PLAN which tools to use from a plain request, (3) run the tools, (4) let the AI SUMMARISE the results. Swap the tools and you have a brand-new agent for a different job.

Fig. Sidebar - active client, reports and tickets

7. Accounts, roles and reports

- **Sign in / sign up:**
team members register with a private organization code; passwords are stored securely (never in plain text).
- **Roles:**
a MEMBER sees only their own projects; an ADMIN sees and manages all of them.
- **Reports:**
every scan produces a downloadable Excel + CSV, listed in the sidebar.
- **Support tickets:**
any user can raise an issue; the admin is alerted and can resolve it.

8. Reading the results

Rankings come from real Google data, so positions are accurate.

- **A position like 4.6**
means page 4, result 6 in Google.
- **'Not in top 100'**
means the site was not found in the first 100 results checked - the agent is honest rather than guessing.
- **Every answer states the website + keyword it used**
so a result is never ambiguous.

In short, with SERP Agent you can:

- **Ask in plain English**
no reports, dashboards or training needed - just chat.
- **Trust the numbers**
real Google top-100 positions, never guessed or estimated.
- **Reuse it for anyone**
any client, any website, any keyword - the same agent adapts.
- **Work as a team**
members manage their own projects; an admin oversees everything.

In summary: you ask in plain English, an AI agent plans and runs the right tools, checks real Google rankings, and replies clearly - for any client, any keyword, any website.
